

SilverGlo™

CRAWL SPACE WALL INSULATION

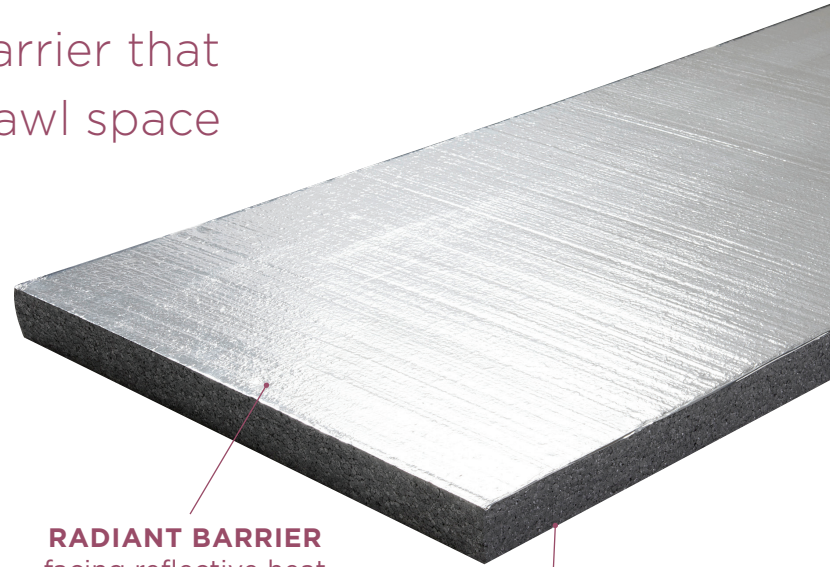

It's important to insulate crawl space walls in any climate. SilverGlo™ is expanded polystyrene insulation with graphite infused into it. These tiny particles reflect heat and lower the material's conductivity for superior R-value per inch.

SilverGlo™ features a radiant barrier that reflects heat back into your crawl space for ultimate energy savings.

SilverGlo™ makes your crawl space and floors above them warmer in the winter, and lowers your cost of homeownership by reducing your heating bills. If you have ducts in your crawl space, you will especially benefit.

An alternative called **Foamax** is a polyisocyanurate foam board insulation that provides excellent insulation qualities for crawl space walls.
