

Permanently Stabilize Your Slab Floors

PN #MBSPH

FSI SLAB PIER SYSTEM

Happy Homes Demand Real Support.

YOUR HOME IS PRECIOUS. It's where you grow your family, welcome friends, and create lasting memories. Nothing should stand in the way of that. As the concrete slabs in your home begin to crack and settle, the very foundation from which your life is built becomes compromised. Finding a permanent solution that addresses the true cause of your settlement problem is the surest way for you to get on with your life's happenings and enjoy peace of mind.

How did your slab floors get this way?

After a home is constructed, changes in the soil beneath the slab are the primary cause of slab settlement. Poorly compacted fill soils and moisture changes, caused by plumbing leaks, HVAC leaks, or drought-like conditions, create soil movement. That movement shifts and settles your floor slab, causing cracked, uneven floors and dangerous tripping hazards.

The Proven Solution

THE SLAB PIER SYSTEM by Foundation Supportworks, Inc. permanently stabilizes the concrete floor slabs in your home. Steel pier sections are hydraulically driven through a heavy-duty slab bracket to reach competent, load-bearing soil. The system is uniquely designed to potentially lift your slab and any non-load bearing partition walls that may have settled along with the slab.

FSI Slab Pier Systems are installed year-round, and warrant against any further movement. Restore your property value and enjoy peace of mind right away.

Our Promise, Your Property

Rest assured that the FSI Slab Pier System will immediately stabilize and permanently protect your concrete foundation slab against any further settlement. The slab pier solution comes with a 25-year warranty against manufacturing defects and a performance warranty from your local dealer.

ADVANTAGES

Reduces trip hazards

Deep solution extends beyond troubled soils

Below grade solution concealed from sight

Galvanized steel will not rust

INSTALLATION

1

Small hole cored through concrete floor slab

2

Slab bracket positioned beneath concrete

3

Steel tubes hydraulically driven down into competent soils

4

The slab is lifted back to a level position if possible

5

Concrete is poured into the finished hole and smoothed
